

Behind Cooktops

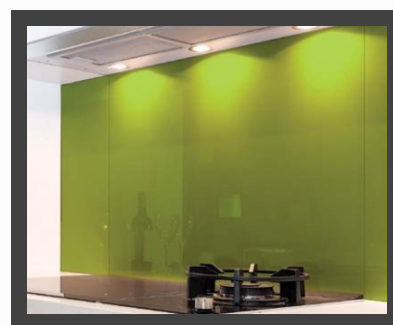

Bellessi can be installed behind cooktops!
4mm or 6mm Bellessi Polymer is suitable for use behind induction and ceramic electric cooktops

Electric Cooktops

You can install your Bellessi panels directly behind any electric, ceramic or induction cooktop. Radiant heat can damage any splashback

Gas Cooktops

The complete Bellessi range allows for use behind gas cooktops with Glass or Stainless Steel Filler Panels

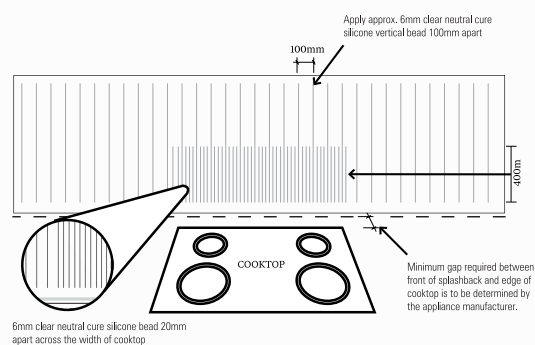

Radiant heat has the potential to damage any splashback even toughened glass or tiles

Please check with the cooktop manufacturer for recommended distance to splashback

You can use any thickness Bellessi polymer behind an electric cooktop, however please note any cooktop left uncovered has the potential to damage any type of splashback – polymer, acrylic, glass, tiles etc

** Australian standards require you to have a non combustible material behind your gas cooktop.*

Hot Tolerance

Do not leave your hot plate uncovered. An exposed cooktop emits far greater radiant heat than when covered and this can damage your splashback.

Bellessi is only covered under warranty against normal wear and tear. See installation instructions for best advice installing near cooktops. For warranty or heat tolerance further explanation contact: warranty@bellessi.com.au
